

Abstract

The invention relates to adhesion promoters for plastisols based on polyaminoamides, characterized in that the adhesion promoter comprises not only a polyaminoamide but also at least 10% by weight, and at most 60% by weight, based on the total amount of adhesion promoter, of ethyldiglycol (ethyl Carbitol), and to a process for the production of coatings and adhesive bonds for materials, and also to plastisols in which these adhesion promoters are used concomitantly.
